2. Choice of the supported cluster model

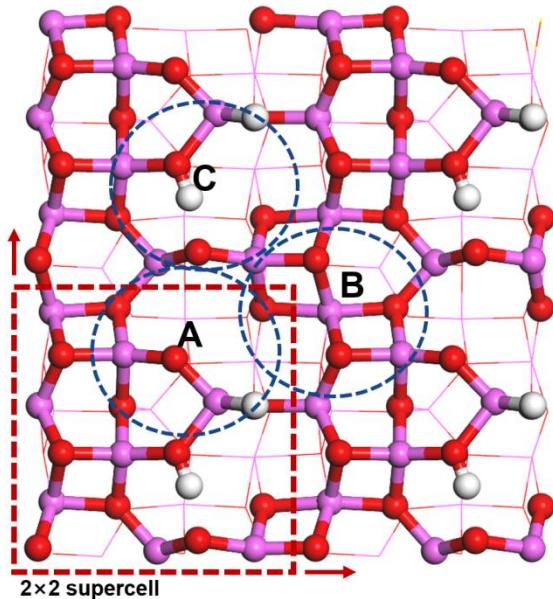

Fig. S8 Typical binding sites for Cu₁₃ cluster on the γ -Al₂O₃(110) surface

The adsorption sites for the hydrated γ -Al₂O₃(110) surface are chosen according to the study of Marius et al., as shown in Fig. S7.²⁶ The Cu₁₃ cluster is first optimized in the gas phase and then is placed over these three sites. The adsorption test is carried out by static DFT calculations and the most stable configuration at A site is selected to be the main structure for further CO₂ hydrogenation calculations, as shown in Fig. S8. It should be noted that the final configuration is not validated by a molecular dynamic checking, thus the sampling is not complete for the whole system. But this method has been validated to be practical in previous studies and the configuration we use should be able to represent the supported Cu₁₃ cluster model to provide acceptable results.^{26,27}
